

Air-hydro Unit CC Series

The air-hydro unit consists of a converter and a valve unit that are compactly integrated. It converts air pressure to an equivalent hydraulic pressure, and this hydraulic pressure is used for operating an actuator, thus solving the problem that is associated with the compression characteristics of air. Thus, in spite of using pneumatic equipment, it performs similarly to a hydraulic unit, operating at a constant speed during starting or in the presence of load fluctuations, and at the same time solving the problems of sticking and slipping associated with low speed operations. This unit is ideal for achieving accurate and constant speed of the cylinder, intermediate stopping, skip movement, or for slow operation of a rotary actuator.

■ High cylinder operation speed

Through the availability of a wide range of series in terms of converter capacity and valve unit flow rate control capability, speeds as high as 200 mm/s (throttle valve) can be achieved with a $\varnothing 80$ cylinder. (Operating pressure: 0.5 MPa, unloaded, piping: bore 19 mm x 1 m)

Air-hydro Converter CCT Series

Examples of Application

① Function of stop valve

Prevents load dropping (In an emergency)

Multipoint intermediate stops

Fixed end point

(Not only solid but also liquid is available if there is pump mechanism at the end.)

② Function of skip valve

Fast forward to working process

③ Flow control valve

(With pressure compensation)

Uniform driving for load fluctuations

④ Throttle valve/Speed controller

- Working without jumping at low speeds or when starting
- Control with throttle valve and speed controller when transferring and carrying

Air-hydro Unit

CC Series

Caution

Be sure to read this before handling the products.

How to Select

① Select the bore size of air-hydro cylinder

First of all, select a bore size from data D <Theoretical Output Table>. When making a selection, the ratio between the theoretical output and the load should be 0.5 or less.

② Select converter

Select the nominal diameter and the effective oil level stroke from data A, <Cylinder Displacement and Converter Capacity Diagram>. When selecting a converter by its nominal diameter, the converter's oil level speed should be 0.2 m/s or less.

Cautions of Selection

① Make sure to select a cylinder and a rotary actuator for an air-hydro operation. Do not use these for pneumatic operations because they will lead to oil leaks.

Air-hydro cylinder: CA1□H□-□,
CQ2□H□-□,
CS1□H□-□,
CM2□H□-□,
CG1□H□-□(to Ø 63),
HC03-X1-□X□

Air-hydro rotary actuator:
CRA1H□-□

② When determining the size of a converter based on the <Cylinder Displacement and Converter Capacity Diagram>, do not select a converter bore that is too small for the cylinder's bore size because this will increase the oil level speed, causing the oil to blow out. Thus, select a converter bore so that the oil level speed will be 200 mm/s or less.

Data A Volume of cylinder/Capacity of converter

How to view the diagram (ex: when using a Ø 100 to 450 st cylinder): Draw a line perpendicularly from the cylinder stroke of 450 to the point at which it intersects the (curve) cylinder bore size of Ø 100, and extend it to the left to obtain the displacement of approximately 5.300 cm³. Then, select a converter with a larger capacity. The converter will be Ø 160 to 300. To obtain the capacity of the converter, multiply the cylinder displacement by approximately 1.5.

Note: Select the nominal diameter of the converter so that the converter's oil level speed does not exceed 0.2 m/s.

Air-hydro Unit

CC Series

Specific Product Precautions

Be sure to read this before handling the products.

Air supply

1. A mist separator prevents the intermixing of drainage, preventing the air-hydro unit from malfunctioning, and prolonging the life of the oil.

Environment

1. Avoid use near fire.
2. Don't use in the clean room.

Mounting

1. Install the converter vertically.
2. Install the converter at a position that is higher than the cylinder. If placed lower than the cylinder, air accumulates in the cylinder. Use the air bleed valve on the cylinder to bleed the air. If the cylinder is not provided with an air bleed valve, loosen the hydraulic pipe to bleed.
3. Leakage associated with the sliding movement inevitably occurs. In particular, with the single side hydro unit, the operating oil that leaks to the pneumatic side will be discharged from the switching valve, thus soiling the switching valve. Thus, install an exhaust cleaner (AMC Series). (Fig.6)

When the oil case of the exhaust cleaner becomes full, operating oil will blow out of the exhaust cleaner. Therefore, open the drain valve on a regular basis.

Figure 6

Piping

1. Before connecting the pipes, remove any foreign matter.
2. The {T Series W (white)} nylon tubing can be used for hydraulic piping. Self-aligning fittings can be used for hydraulic piping, but one-touch fittings cannot be used.
3. Make sure that there are no extreme differences in the bore of the pipes used for hydraulic piping. Also check for protrusions or burrs.
4. Prevent air from being drawn into the hydraulic piping.
5. When operating a stop valve or a skip valve with a solenoid valve, considering it is an external pilot, provide pneumatic piping with 0.3 to 0.7 MPa of air pressure. The pressure for the pilot must be set to the operating pressure of the cylinder or higher.
6. To pneumatically operate a stop valve or a skip valve, set the signal air pressure to 0.3 to 0.7 MPa. The pneumatic operating pressure must be set to the cylinder's operating pressure or higher.

Piping

7. The stop and skip valves must be "normally closed".
8. Be aware that the specified speed might not be attained if there is restriction in the fittings or there are 90° bends.
9. Air bubbles could form during operation due to cavitation. To prevent this:
 - Configure the piping from the cylinder to the converter to have an ascending gradient.
 - Shorten the hydraulic piping.

Maintenance

Double-side hydro

1. Even as a double side hydro unit, leakage occurs with the sliding movement of the air-hydro cylinder, increasing the converter's operating fluid in one area and decreasing it in the other. Fig. 7 provides a countermeasure circuit. Maintain the converter's oil level at an appropriate level by opening valve A.

Figure 7

Single-side hydro

2. The basic composition of the air-hydro system is the double side hydro; however, it can also be used as a single side hydro. The viscosity of the operating oil of the single side hydro is approximately one half of the double side hydro. The speed will be approximately 1.4 times the data given on page 3. When the system is used as a single side hydro, air could become intermixed with the operating oil, leading to the symptoms listed below:
 - 1- Cylinder's speed is not constant.
 - 2- Stopping accuracy of the stop valve decreases.
 - 3- Overrun of the skip valve increases.
 - 4- The flow control valve with pressure compensator knocks (even with a small flow rate).Therefore, it is necessary to check periodically to prevent air from intermixing with the oil. If the symptoms described above occur, air must be bled. In particular, to prevent "4", use a double side hydro.

Lubrication

If the converter is positioned higher than the cylinder:

1. Make sure to move the cylinder's piston to the stroke end of the side that will be filled with oil.
2. Open the air bleeder valve on top of the cylinder.
3. If equipped with a stop valve, provide a pilot pressure of approximately 0.2 MPa to the stop valve, and maintain the stop valve in an open position through manual operation or by applying current.

Lubrication

4. Open the oil filler plug to fill with oil. When air no longer comes out intermixed with oil, close the cylinder's air bleeder valve. Make sure that the oil level is near the upper limit mark on the level gauge, and replenish with oil if needed.
5. Next, fill the opposite side with oil. Move the piston to the stroke end of the side that will be filled with oil, and perform steps 1 through 4 in the same sequence as described above.

If the converter is positioned lower than the cylinder:

After filling with oil as described in step 4 above, close the oil filler plug. Then, introduce air pressure of approximately 0.05 MPa into the converter's air port to push the oil into the cylinder. When air no longer comes out intermixed with oil, close the cylinder's air bleeder valve. Perform the remaining steps in the same way as when the converter is located higher than the cylinder, in order to fill it with oil.

* This operation necessarily causes air to accumulate in the cylinder during the operation of the cylinder. Therefore, air must be bled on a regular basis.

Fluid (Hydraulic fluid)

1. Use petroleum based turbine hydraulic operating oil. The use of non-combustible operating oil could lead to problems. An appropriate viscosity is about 40 to 100 St at the operating temperature. Using ISO VG32 oil, the temperature range will be between 15 and 35 °C. To operate in a temperature range that exceeds that of the ISO VG32 oil, use ISO VG46 (25 to 45 °C).

Turbine oil of ISO VG32

(Example) <No additive>

Idemitsu: Turbine oil P32

Nisseki: Turbine oil 32

Maruzen: Turbine oil 32

Mitsubishi: Mitsubishi turbine 32

<Additive>

Idemitsu: Dufny turbine oil

Nisseki: FBK turbine 32

Maruzen: Turbine super 32

Mitsubishi: Diamond turbine oil 32

Air-hydro Converter CCT Series

How to Order

CCT **63** - **100** - Q

● Effective oil level stroke [mm]

● Converter nominal size/stroke [mm]

63	50, 100, 200, 300, 400, 500
100	100, 200, 300, 400, 500, 600
160	200, 300, 400, 500, 600, 700, 800

Specifications

Operating pressure	0 to 0.7 MPa
Proof pressure	1.05 MPa
Ambient and fluid temperature	5 to 50 °C
Fluid	Turbine oil (40 to 100 mm ² /s)

Converter standard effective oil level stroke/effective volume (cm³)

Nominal size [mm]	Standard effective oil level stroke [mm]									Limited flow* (l/min)
	50	100	200	300	400	500	600	700	800	
63	150	300	600	890	1190	1480	—	—	—	36
100	—	750	1510	2260	3010	3770	4520	—	—	88
160	—	—	3660	5490	7320	9150	10980	12810	14640	217

* Limited flow shows the limit of converter of level speed (200 mm/s) which can maintain stability of converter oil level.

Table 1 CE-compliant [mm]

Applicable model	CE marking applicable standard
CCT160-400 to 800	Directive 97/23/EC Category I

CCT40 / Effective oil level stroke

Because the CCT40 is a converter for an actuator with a small capacity, it cannot be made into an air-hydro unit. Instead, use an individual CC valve unit or a speed controller (AS2000, AS3000, AS4000, etc.) through a pipe connection.

Specifications

Operating pressure	0 to 0.7 MPa
Proof pressure	1.05 MPa
Ambient and fluid temperature	5 to 50 °C

If intricate speed control is unnecessary and the changes in speed due to load fluctuations can be tolerated, the pneumatic speed controller can be used as a control valve.

The minimum controllable flow volume of the speed controller is 3l/min.

The speed controller and the converter must have individual pipe connections. They cannot be integrated into a unit.
